

Data Structures

Inverted Search

Team Emertxe

Project1 – Inverted Search

Inverted Search

What ?

Inverted Search

What ?

An inverted index is an index data structure storing a mapping from content, such as words or numbers, to its locations in a table, or in a document or a set of documents.

Inverted Search

What ?

An inverted index is an index data structure storing a mapping from content, such as words or numbers, to its locations in a database file, or in a document or a set of documents

Purpose

The purpose of an inverted index is to allow fast full text searches, at a cost of increased processing when a document is added to the database.

Inverted Search

Types

1. Forward Indexing
2. Inverted Indexing

Inverted Search

Inverted Indexing

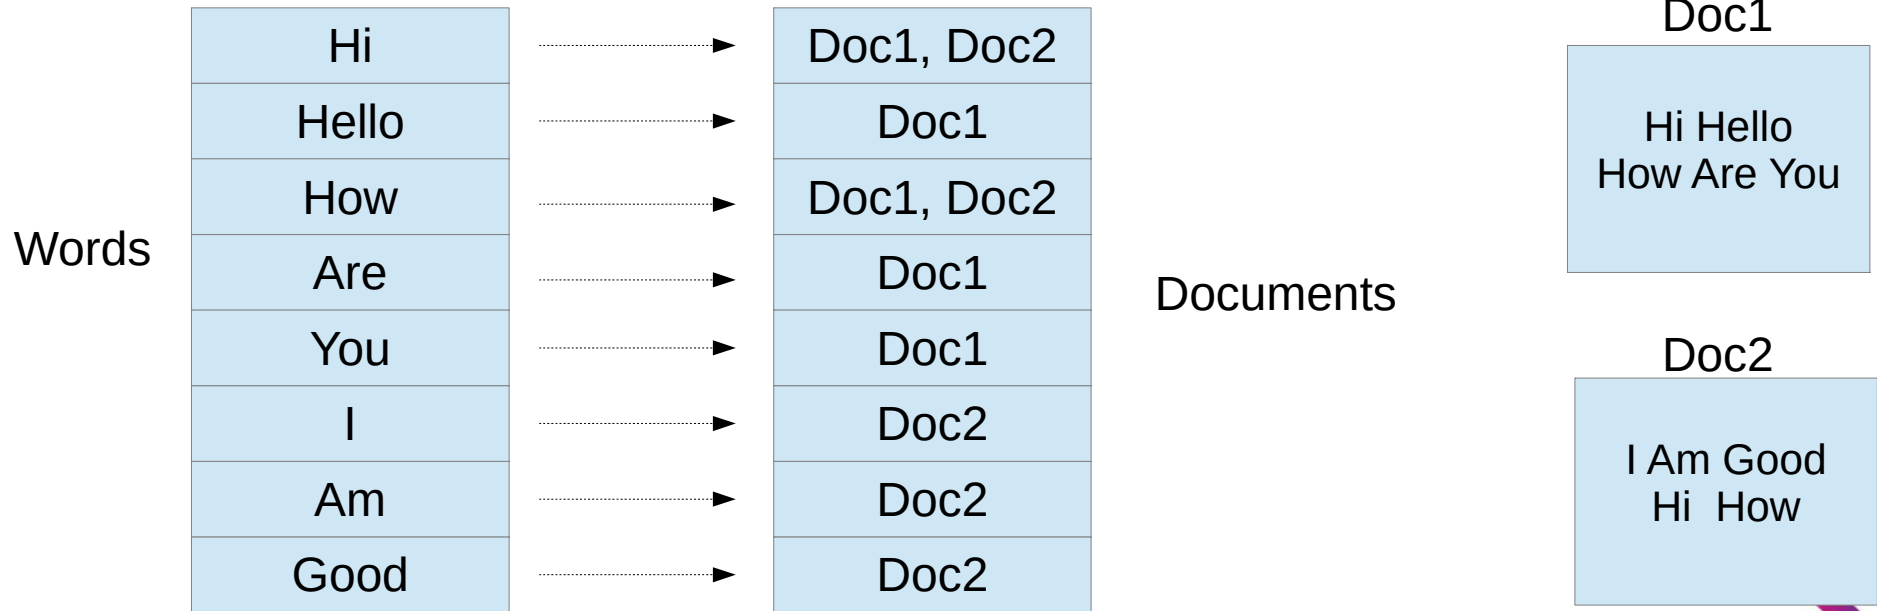

- It is a data structure that stores mapping from words to documents or set of documents i.e. directs you from word to document.

Inverted Search

Inverted Indexing

- Scan the documents, prepare a list of unique words.
- Prepare a list of indexes of all the unique words and map them to a document search

Inverted Search

Inverted Indexing

- It is a data structure that stores mapping from words to documents or set of documents i.e. directs you from word to document.

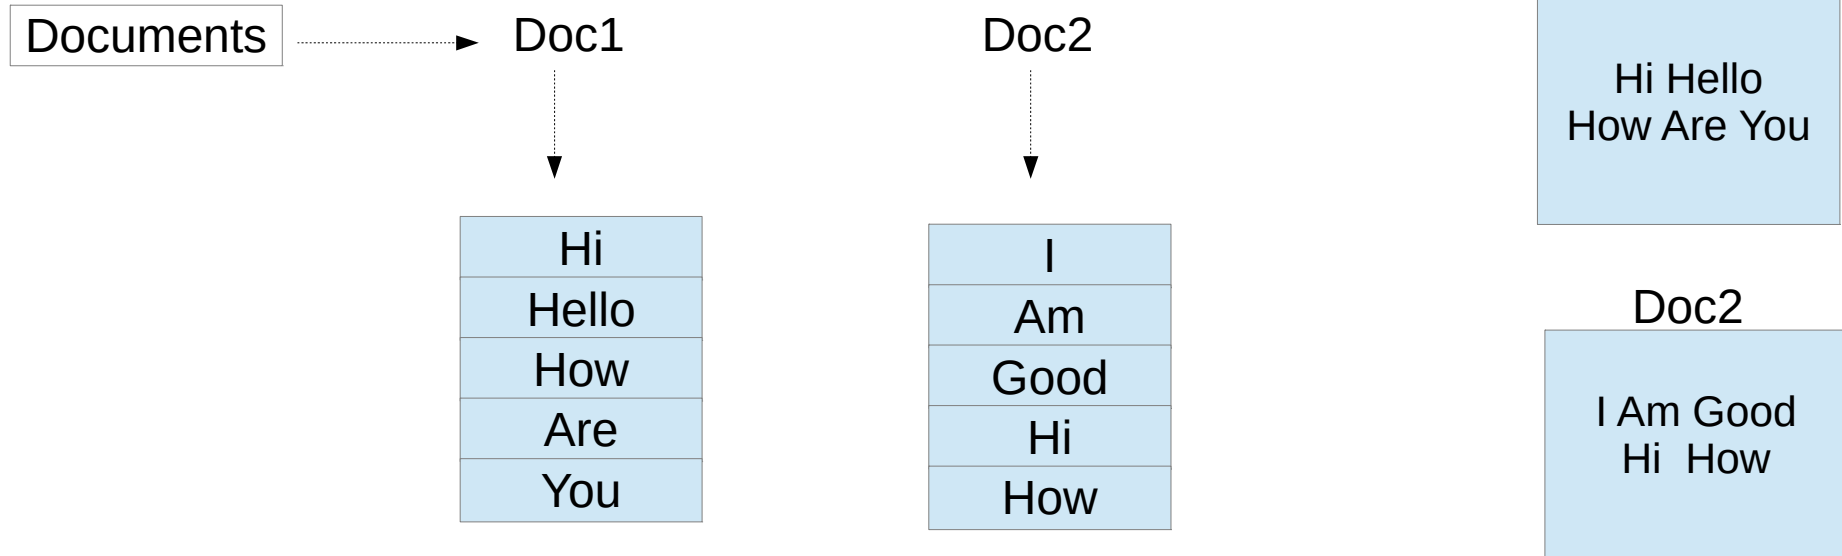

Forward Indexing

- It is a data structure that stores mapping from documents to words i.e. directs you from document to word.

Inverted Search

Forward Indexing

- Scan the document,prepare a list of unique words
- Map all the words to a document as an index

Inverted Search

Inverted Indexing

- It is a data structure that stores mapping from words to documents or set of documents i.e. directs you from word to document.
- **Real life example of Inverted index:**
- Index at the back of the book.

Forward Indexing

- It is a data structure that stores mapping from documents to words i.e. directs you from document to word.
- **Real life examples of Forward index:**
- Table of contents in book

Data Structure –Project

Inverted Search

Inverted Indexing

- It is a data structure that stores mapping from words to documents or set of documents i.e. directs you from word to document.
- Real life example of Inverted index:
- Index at the back of the book.

—Index—

—A—

about the author 128, 132, 412
account info 295
active table of contents 34, 120-124, 238-239,

Inverted Search

Forward Indexing

- It is a data structure that stores mapping from documents to words i.e. directs you from document to word.
- Real life examples of Forward index:**
- Table of contents in book

Inverted Search

Advantages of inverted Index:

- It is easy to develop
- It is used in document retrieval system
- Search engines

Inverted Search

Operations:

- 1.Create Database
- 2.Display Database
- 3.Search Database
- 4.Update Database
- 5.Save Database

Create Database

Inverted Search

Create Database:

1. word
2. table link

File count	word
link_table address	Link for next node

wlist

word count
File name
link

link_table

File1.txt

hi hello how are you

File2.txt

hello hi i am fine

Inverted Search

Create Database:

Index = data % 97
= 'h' % 97
= 7

File1.txt

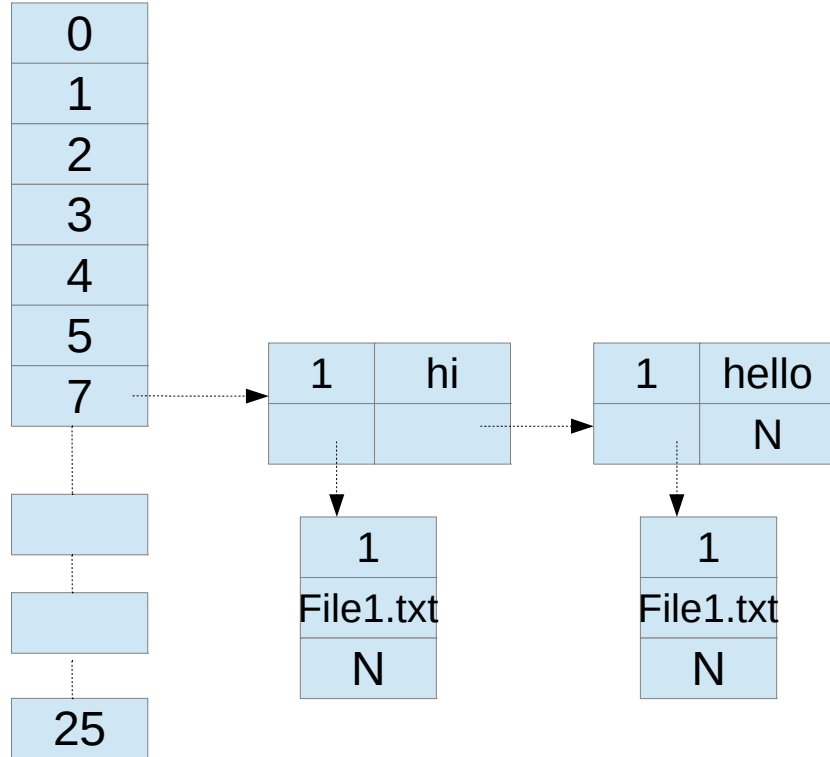

hi hello how are you

File2.txt

hello hi i am fine

Inverted Search

Create Database:

$$\begin{aligned}\text{Index} &= \text{data} \% 97 \\ &= \text{'h'} \% 97 \\ &= 7\end{aligned}$$

File1.txt

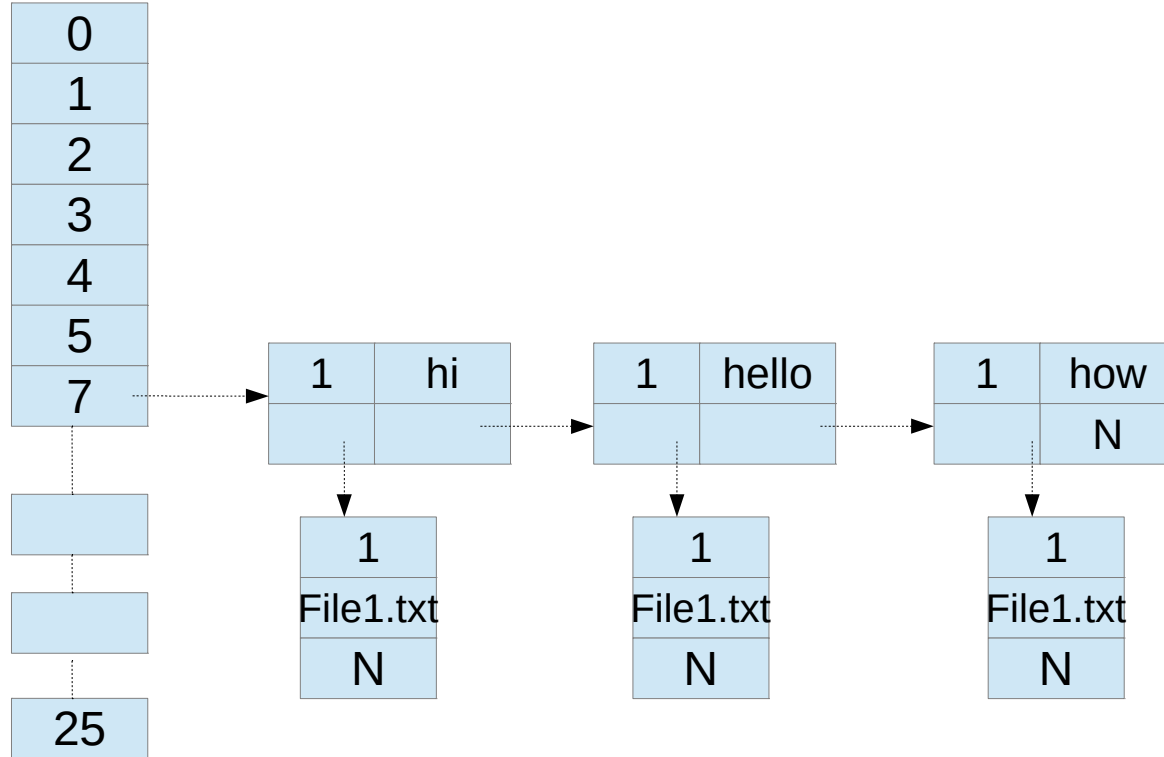

hi hello how are you

File2.txt

hello hi i am fine

Inverted Search

Create Database:

$$\begin{aligned}\text{Index} &= \text{data} \% 97 \\ &= \text{'h'} \% 97 \\ &= 7\end{aligned}$$

File1.txt

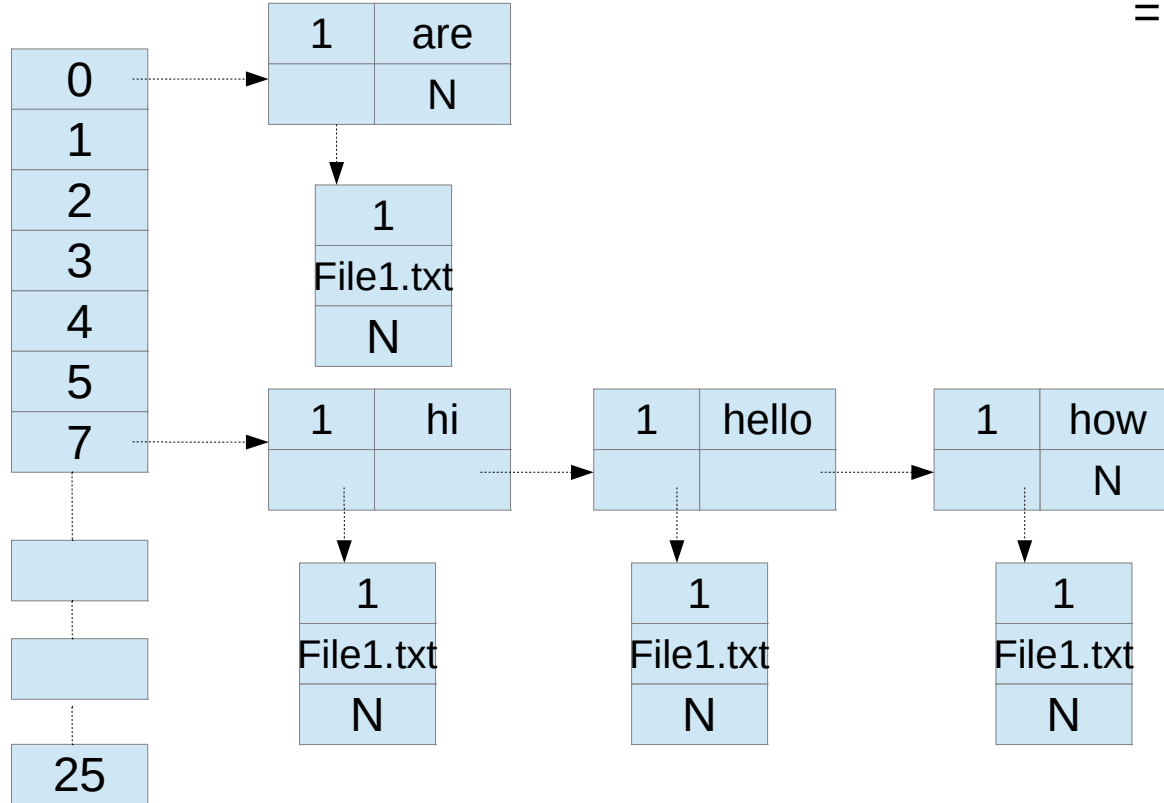

hi hello how are you

File2.txt

hello hi i am fine

Inverted Search

Create Database:

$$\begin{aligned}\text{Index} &= \text{data} \% 97 \\ &= 'a' \% 97 \\ &= 0\end{aligned}$$

File1.txt

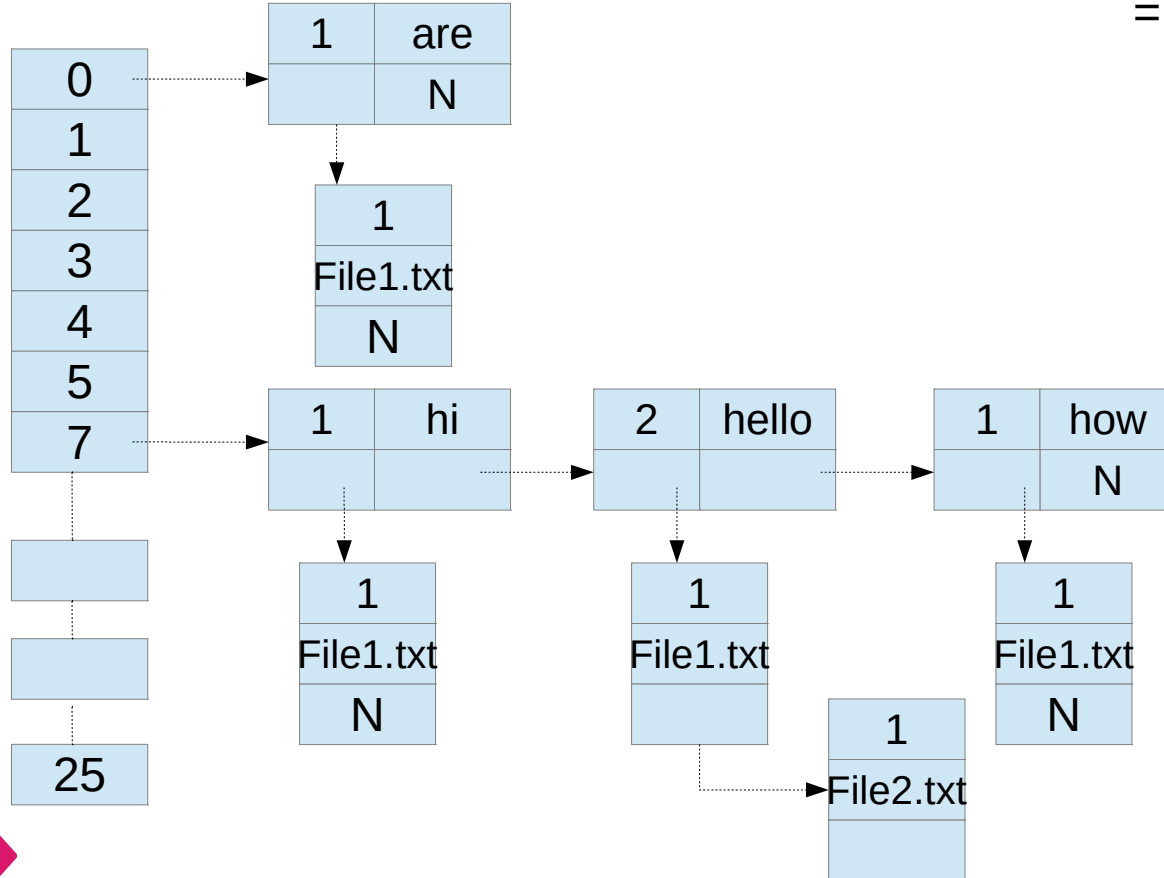

hi hello how are you

File2.txt

hello hi i am fine

Inverted Search

Create Database:

$$\begin{aligned}\text{Index} &= \text{data} \% 97 \\ &= \text{'h'} \% 97 \\ &= 7\end{aligned}$$

File1.txt

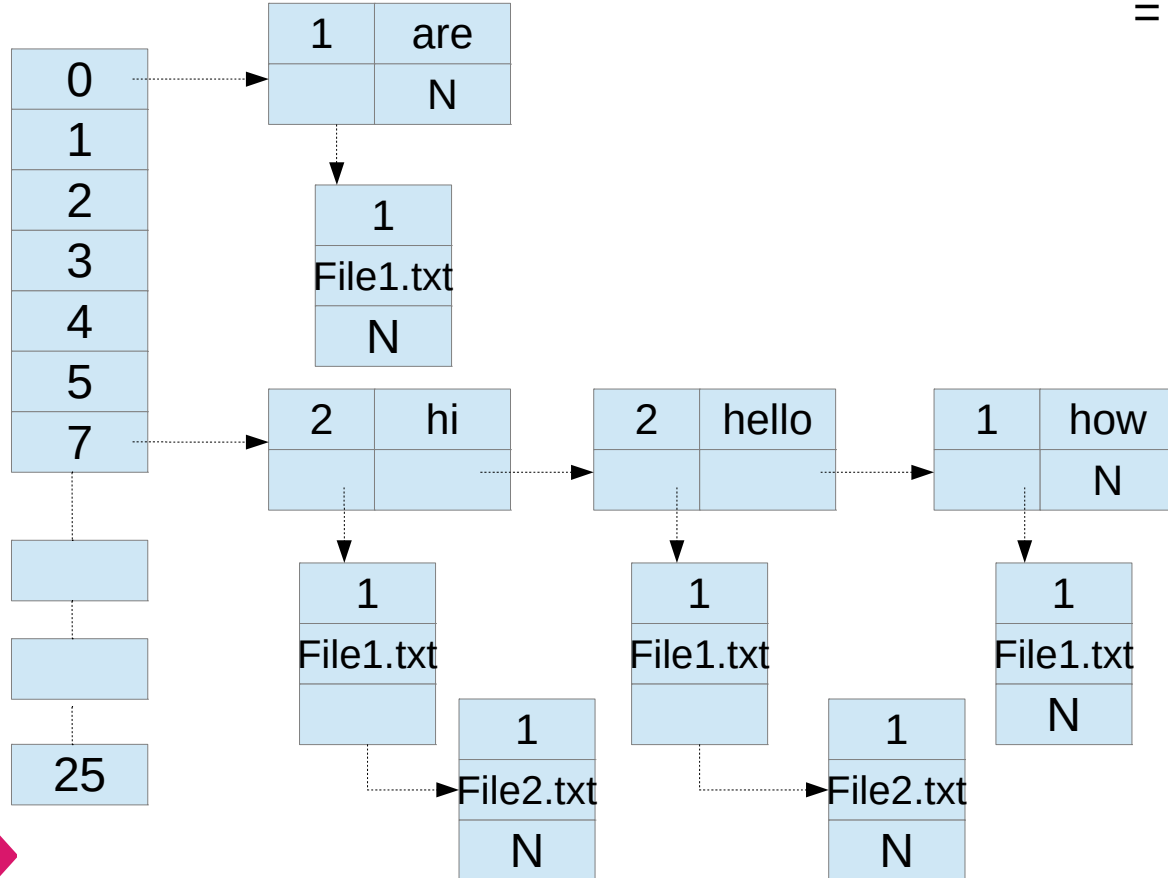

hi hello how are you

File2.txt

hello hi i am fine

Inverted Search

Create Database:

$$\begin{aligned}\text{Index} &= \text{data} \% 97 \\ &= \text{'h'} \% 97 \\ &= 7\end{aligned}$$

File1.txt

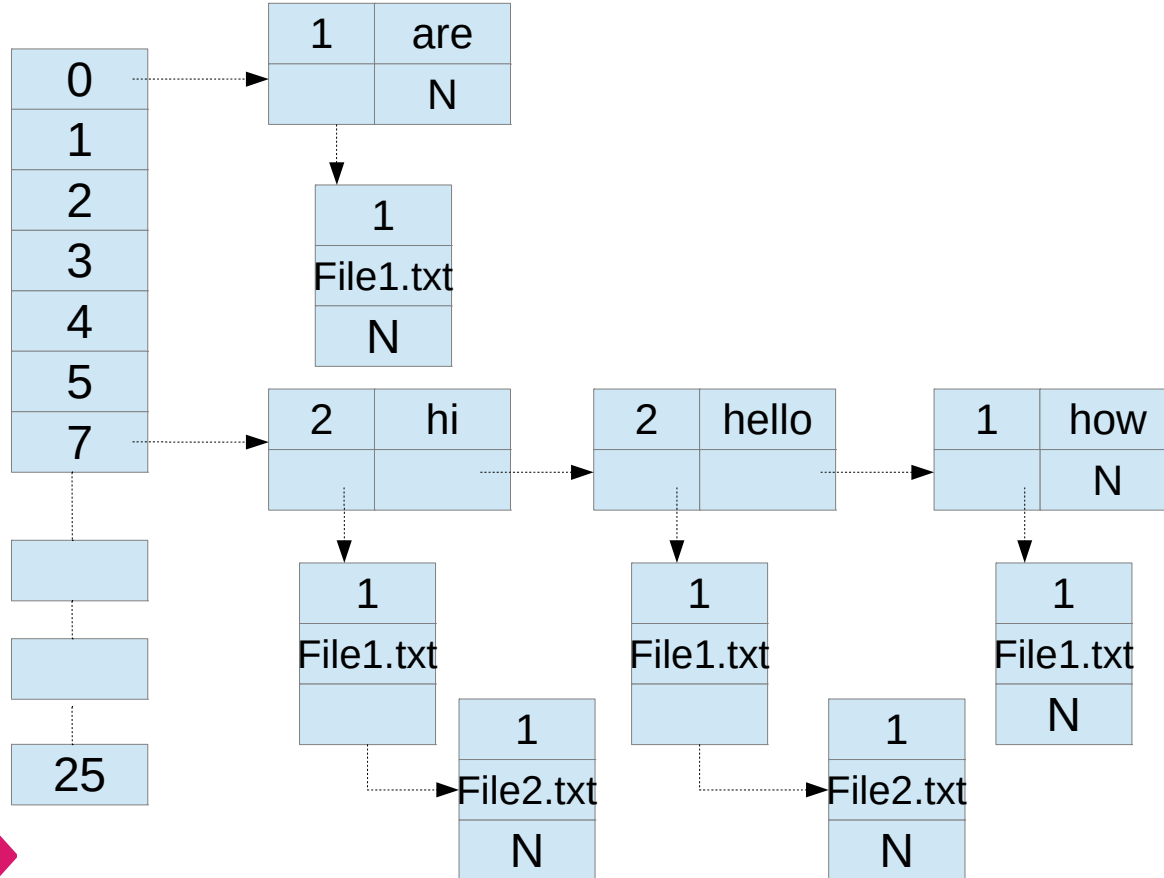

hi hello how are you

File2.txt

hello hi i am fine

Inverted Search

Create Database:

File1.txt

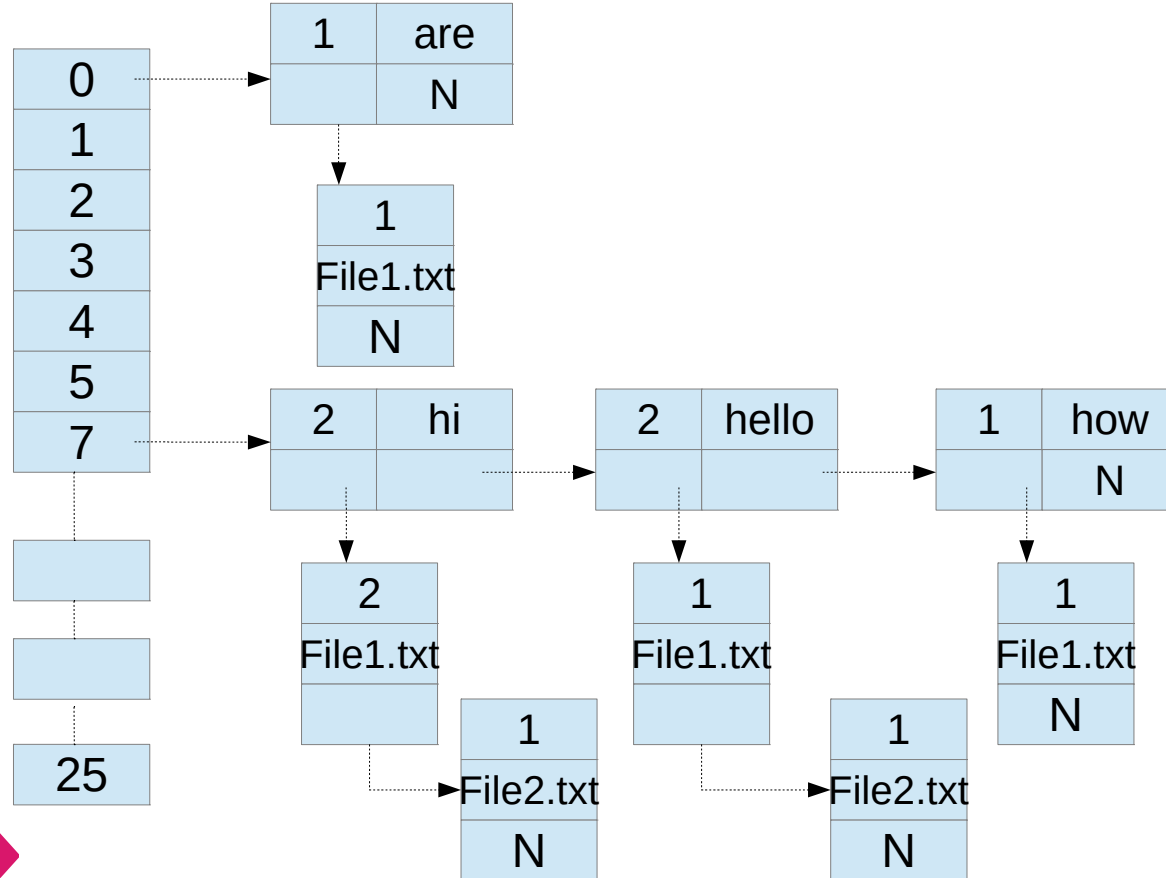

hi hello how are you
hi

File2.txt

hello hi i am fine

Inverted Search

Create Database:

File1.txt

hi hello how are you
hi

File2.txt

hello hi i am fine

Create Database:

Create nodes:

Table node :

```
typedef struct table
{
    int word_count;
    char f_name[FNAME_SIZE];
    struct table *link;
}tlink_t;
```

word node :

```
typedef struct word
{
    int file_count;
    char word[WORD_SIZE];
    struct word *link;
    tlink_t *tlink;
} wlist;
```

Inverted Search

Create Database:

Rules:

- 1 If Words are same and Filenames are also same
-> **Increment word count**
2. If words are same and Filenames are different
-> **Increment file_count and allocate memory for table link**
3. If word are different and Filenames are different
-> **Allocate the entire block(word & table)**
- 4.If words are differnt and filenames are same
-> **Allocate the entire block(word & table)**

Create Database:

Create nodes:

Table node :

```
typedef struct table
{
    int word_count;
    char f_name[FNAME_SIZE];
    struct table *link;
}tlink_t;
```

f_name node :

```
typedef struct file
{
    char filename[WORD_SIZE];
    struct file *link;
}flist_t;
```

word node :

```
typedef struct word
{
    int file_count;
    char word[WORD_SIZE];
    struct word *link;
    tlink_t *tlink;
} wlist;
```

Display Database

Inverted Search

Display Database:

Printing Pattern:

1. Search for the index which is not empty.
2. Display the index number and details as follows.
-> [ind_no] <word> <file_count> <filename> <word_count>

Inverted Search

Display Database:

```
[0] [are]      1 file(s) : file : File1.txt : 1 time(s)
[7] [hi]       2 file(s) : file : File1.txt : 2 time(s) : File2.txt : 1 time(s)
    [hello]    2 file(s) : file : File1.txt : 1 time(s) : File2.txt : 1 time(s)
    [how]      1 file(s) : file : File1.txt : 1 time(s)
```

Search Database

Inverted Search

Search Database:

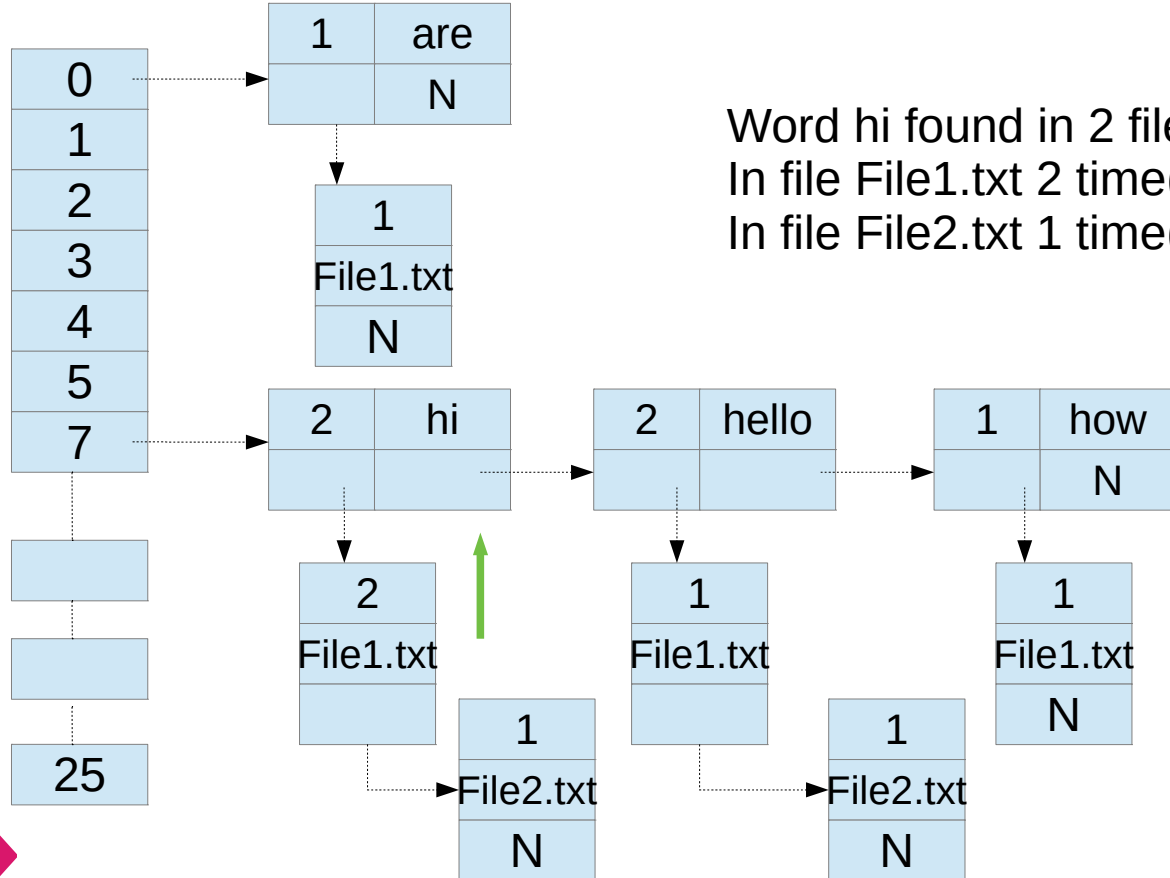

1. Read the word to be searched in Database
2. Example the word is **hi**

Inverted Search

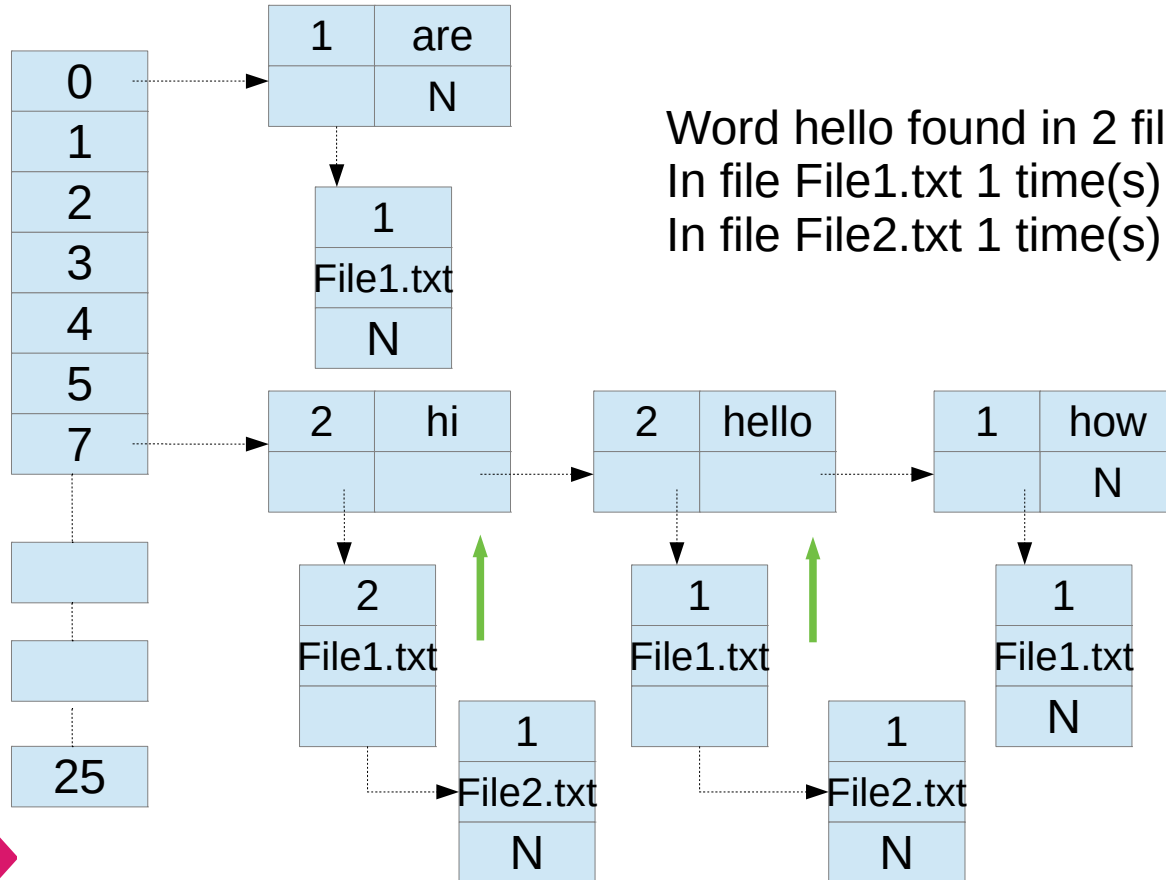

$$\begin{aligned}\text{Index} &= \text{data} \% 97 \\ &= \text{'h'} \% 97 \\ &= 7\end{aligned}$$

Search Database:

Inverted Search

Search Database:

$$\begin{aligned}\text{Index} &= \text{data} \% 97 \\ &= \text{'h'} \% 97 \\ &= 7\end{aligned}$$

Word to be searched:
hello

Update Database

Inverted Search

File3.txt

how are you

- 1.Read the file to be added in Database
- 2.Let's say the file name is file3.txt

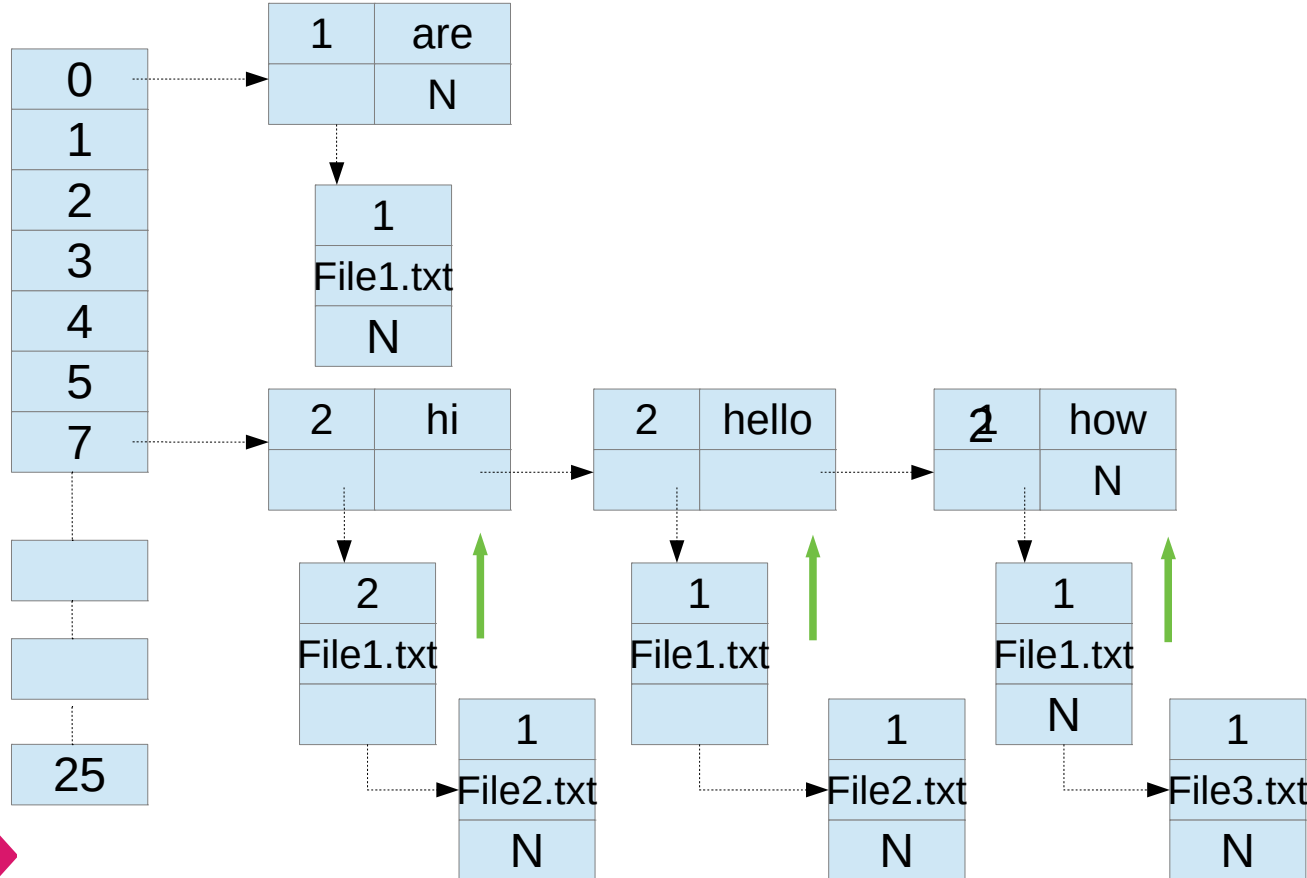

Inverted Search

$$\begin{aligned}\text{Index} &= \text{data} \% 97 \\ &= \text{'h'} \% 97 \\ &= 7\end{aligned}$$

File3.txt

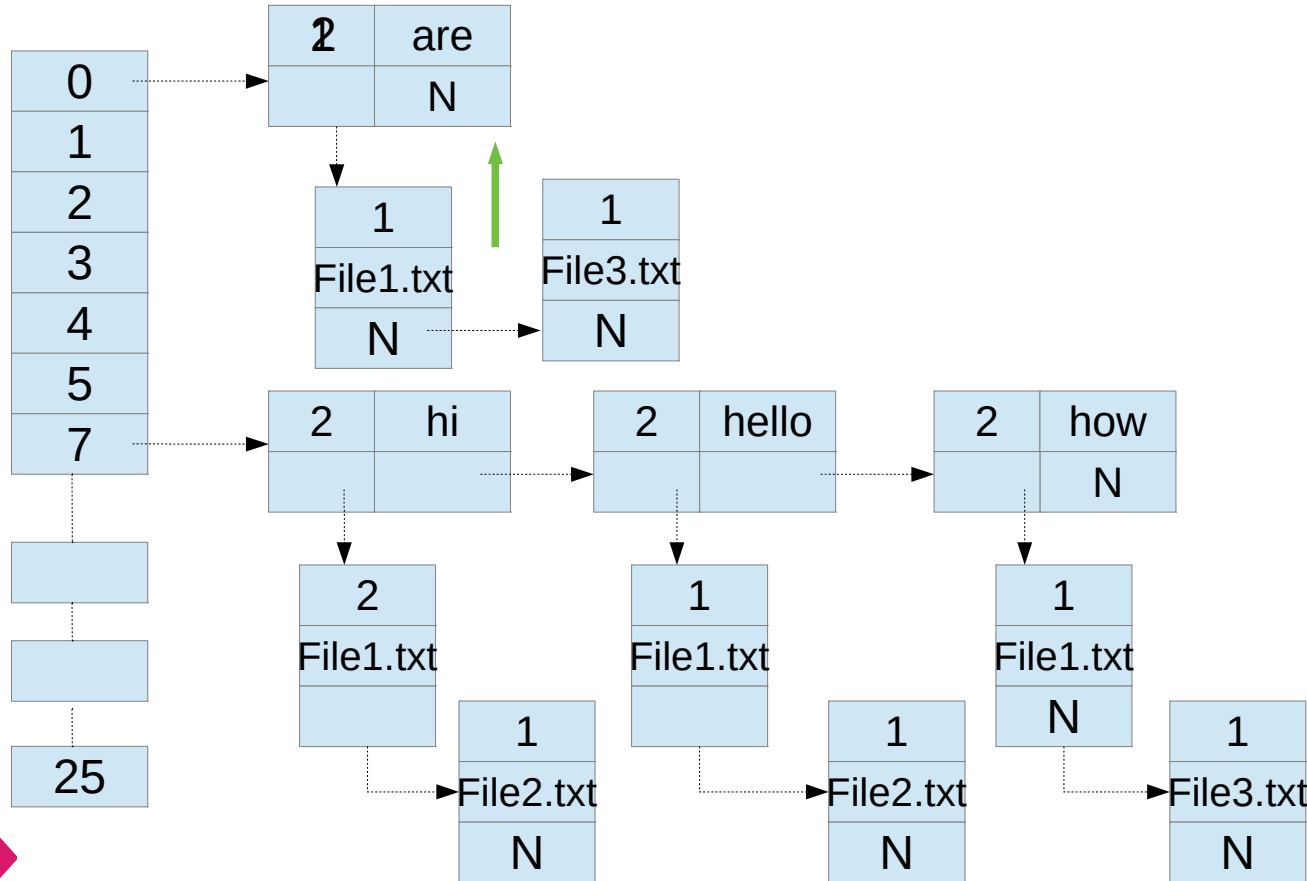

how are you

Update Database:

Inverted Search

Update Database:

File3.txt

how are you

Save Database

Inverted Search

Save Database:

1. Read the backup file name.
2. Let's say the file name is backup.txt
3. Store the contents in given pattern.
 1. #<index_no>;
 2. <word>;<file_count>;<file_name>;<word_count>#

Validations

Inverted Search

Validations :

1. Check the filename passed through CL.
 1. If yes continue further.
 2. Else print error and stop
2. If passed then store the filenames in Linked list and check the filenames are different.
 1. If no print error for duplicate filenames.
2. Check the file is present and it is not empty file.
3. If filenames are different then continue.
4. The above validations applicable for Update DataBase too.
5. For display database, you need to display the index numbers which are not empty.
6. Search Database :
 1. Read the word
 2. Check the word is present
 1. If present then print the details in given pattern.
 2. Else print error.
